

Distribution Warehouse

More than just a logistics building

After an erection period of just over six months, the company Centrum Klima was able to move into its new premises. The distribution warehouse was constructed by our Polish partner Skalski, located in the area. Centrum Klima is a manufacturer of air-conditioning and ventilation systems on the Polish and European Market.

On a ground surface of 8,500 m², the company now has several buildings for different functions. Located at the centre of the site are the 5,000 m² logistics hall and the connecting 3,500 m² production hall. The production facility is a single storey steel construction and has an integrated gantry crane that can transport goods of up to eight tons. The distribution warehouse has a euro pallet racking system with five levels and with

plenty of space for manoeuvring goods. There is a very sophisticated loading system in the warehouse.

The connecting office building has a modern meeting room, spacious offices and a canteen for employees.
