

Sustainable Office Building

With clear lines and a modern design

A company dealing with sustainability naturally needs a sustainable office. This is also the case for the Belgian company Steel, which specializes in energy management and required a new head office. Together with Builder Partner Wust, Astron constructed a 1,500 m² building, which meets all the specifications of the client as well as the requirements for the ISO 14001 certification (environmental management standard).

Clear lines, a modern design, a curved roof and a lightweight construction with lots of glass provide a pleasant atmosphere in the interior of the building. In this successful example of a sustainable office, all the requirements with respect to insulation and air circulation have been ideally fulfilled.

The customer was also very happy with the total cost and construction period of the office building.
