

## Multi-storey Customer Car Parks

### Made for client needs

The biggest advantages of the Astron multi-storey customer car park are its light construction, short erection time and the low costs for the foundation. These arguments convinced Luxembourg's main energy supplier, Enovos.

Within a short time, Astron erected a multi-storey car park for about 400 customers' and employees' vehicles on 5 levels. The load-bearing construction consists of columns and secondary beams with 16 m free spans, which facilitates easy parking and the opening of doors without disturbing columns.

This car park has an open design and is naturally ventilated - factors that are of advantage both ecologically and economically. With their large eye-like openings, the modern cellular beams "Angelina" blend well into a con-

temporary and light architecture that gives the user a feeling of openness, comfort and clarity. The facades have timber cladding that act as sun protection and give the building a natural look so that it blends well into its environment.
